Kendo grid column client template if else

Columns. Bound(p => p.Active). ClientTemplate(\\#if('#=Active#'=='Y') {\\<input type='button' value='OK'>\\}\\#). Width(150). Title(Status); but condition taken as string?? #if('Y'=='Y')'enter code here' { <input type=button value=OK> }# columns. Bound(c => c.ItemId) . ClientTemplate(# if (condition-1) { # + # if(condition-2) { # + content-a # } # + #} else { # + # if(condition-2) {# + content-two # } # # # } #) There are three ways to use the hash syntax: Render values as HTML: #= #. Use HTML encoding to display values: #: #. Execute arbitrary JavaScript code: # if (true) { # ... non-script content here... #} #. Simple If Else #if (Id ===null) + {# +- + #}else{# + #=Id# + # }# I was working on a Kendo Grid today that used MVC cover to define a client detail template and ran into a very frustrating problem that I thought I would post about and hopefully save some other hours of head-banging. For anyone who has spent a lot of time with Kendo, you know that the documentation can be quite and not go into a lot of details. It often leaves out important details that you end up finding buried in a forum post or on StackOverflow. It happened again today. The situation was quite simple. I had a Grid of Objects and wanted to use a ClientDetailTemplate to display a different Grid of child objects under the parent object. It looked something like this: @(Html.Kendo(). Grid() . ClientDetailTemplateId(product-template) . Name(grid) . DataSource=> dataSource . Ajax() . Read(read => read. Action(Categories_Read, Home))) . Columns(columns => { columns. Bound(product => product. CategoryID); Columns. Bound(product => product. CategoryName); })) Then I defined the client detail template. Note two things: 1) you can use scoped parent properties in the name of the grid (e.g. #=CategoryId#), and 2) you can't have any spaces around that template code in the grid name, or it will throw an error. Here's what my defined template looked like: I thought this was pretty simple, right? Error. I kept getting an error message in the console like: Uncaught ReferenceError: ProductID is not defined Huh? I could see the products came across in the AJAX request, with ProductID defined, but that's which the template couldn't find or read the property. As has happened so many times for me, I stumbled upon the answer buried in a Telerik forum post. The answer even came with a smiley face, which immediately made me giggle and jump around the room. Child grids are designed to be able to obtain its parent property values through client templates using the #=ParentProperty#syntax. However, when calling your own property values, the \\#=OwnProperty\\# syntax is used rather. ☺ No, I lied—I didn't giggle, nor did I skip. So in a client detail template, it is scoped to the parent by default, but you can access the descendants by double escape hash first. So our example from above will be: That's it. I'm done with you for Kendo. You got me again. Your turn! Have you encountered this problem before, or something like that? Have you found yourself frustrated with Kendo's documentation as well? Let's talk about it below in the comments! Related This archive has been archived by the owner. It is now read-only. Look at 63 Star 488 Fork 216 You can't perform that action right now.
